

How Companies Are Tackling the Climate Challenge—and Creating Value

CLIMATE SURVEY 2025

Corporate climate reporting appears to be stalling

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

¹Inclusive of Science Based Targets initiative (SBTi) and non-SBTi targets.

²Full measurement refers to companies that assess all three climate risk types: acute physical risks, chronic physical risks, and transition risks. Partial measurement refers to companies that assess any one or two risk types.

Japan, China, and UK companies surveyed lead on reporting, target-setting, identifying, and measuring climate risk

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

Note: Rankings are based on average across reporting, target-setting, and identifying and measuring climate risks.

¹Inclusive of Science Based Targets initiative (SBTi) and non-SBTi targets.

However, companies continue to invest, and investment levels in mitigation and adaptation are expected to continue rising

Companies expect to increase overall investment in mitigation and adaptation by 16% over the next five years, an average of \$69M per company

Expected investment in sustainability (% of current capital investment budget)

Approximately 70% of respondents plan to either maintain or increase investment levels

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

Companies are increasing their use of internal carbon pricing and climate transition plans

33%

of companies have implemented an internal carbon price

RESPONDENTS (%)

5%

more companies are adopting a climate transition plan

RESPONDENTS (%)

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

The push for decarbonization is driven by the value at stake

Value from decarbonization primarily comes from volume-driven revenue growth and operating expenditure savings

RESPONDENTS (%)

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.
¹Defined as financial value gained from decarbonization initiatives, captured as a % of sales.
²Value equivalent to more than 10% of revenue annually.

Companies face high amount of risk from climate change and can reap benefits through smart investments in adaptation and resilience

\$790M

average climate risk in 2030¹

RISK (\$ MILLIONS)

~1%

of revenue in value from adaptation efforts

RESPONDENTS
(% WHO MEASURE CLIMATE RISK)

>10%

ROI from climate risk projects
expected by ~50% of respondents

RESPONDENTS
(% WHO MEASURE CLIMATE RISK)

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

¹Average per company among respondents that measure all climate risks. Climate risk assessment determines possible damage to company assets given various climate change scenarios and likelihood of a natural disaster.

A group of leaders have already captured significant value from mitigation and adaptation, primarily enabled by digital

Only 7% companies are extracting significant value¹ from either decarbonization or adaptation; 3% capture significant value from both

Digital maturity is the strongest differentiator

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

¹Comparing companies that see significant financial value (equivalent to a value of >10% of revenue) versus those that do not see that same level of benefit.

Leading companies are expanding their digital capabilities beyond AI to support climate initiatives

TECHNOLOGY	DESCRIPTION	EXAMPLE	
 Predictive AI	Uses statistical techniques to forecast future events by analyzing patterns in historical data	Crop yield forecasts, energy demand, deforestation alerts	Artificial intelligence
 Generative AI	Creates new content (e.g., text, images, audio) by learning from existing datasets	Green material design, net-zero plans, low-carbon concepts	
 AI agents	Autonomous systems that learn from data in context, make decisions, and act toward defined objectives	Smart buildings, carbon tracking bots	
 Internet of Things (IoT)	Interconnected devices that collect, share, and analyze data to monitor and manage systems	Smart meters, soil sensors, cold chain tracking	Primarily for adaptation and resilience
 Drones	Unmanned aerial vehicles equipped with sensors for large-area monitoring and data collection	Solar panel scans, tree count drones, methane leak flyby	
 Earth observation	Remote sensing (e.g., satellites) and ground-based systems to monitor environmental changes	Carbon map satellites, glacier melt watch, land use trackers	
 Augmented reality/virtual reality (AR/VR)	Immersive technologies that enhance or simulate real-world environments for analysis and training	Heat loss viewers, virtual audit tours	
 Advanced computing (e.g., quantum computing)	High-performance computing that accelerates complex simulations and optimizations	Solar cell sim, CO ₂ reaction models, power grid optimizers

Leading companies are using AI and other advanced digital solutions more frequently than their peers

Which digital priorities should companies focus on to advance sustainability and unlock value?

- Lean into advanced digital solutions, such as AI, IoT, etc.— leaders use these tools 10% more often than the average company
- Especially invest in AI—most common use cases for top companies include carbon accounting and climate risk modeling
- Selectively explore other solutions where the use case exists for that sector, e.g.,
 - Advanced computing for grid optimization
 - Drones for heavy asset monitoring
 - AR/VR for designing products for sustainability and value

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

¹Comparing companies that see significant financial value (equivalent to >10% of revenue) from decarbonization and adaptation.

SURVEY METHODOLOGY

We surveyed 1,924 executives across multiple countries and sectors

Sources: BCG and CO2 AI Climate Survey 2025 (n = 1924); BCG analysis.

Note: Bar charts may not add up to 100% due to rounding.
